Table of Contents

1 Fortran compiler diagnostic capability

1.1   History

This article was first published in the ACM Newsletter, Fortran Forum, December 2019. The original version had entries for Cray, gfortran, Intel, NAG and Oracle.

- Revision 1 updated the NAG entry to the 7.0 release, and dropped the Oracle entry as we were informed that development of the compiler had ceased.

- Revision 2 updated the Intel entry to the 2021.1 release and gfortran to the 10.2.0 release.

- Revision 3 updated the Intel entries adding coverage of their new ifx compiler.

- Revision 4 updated the Cray entry to cover the 10.0.4 release.

- Revision 5 was an update that covered the following releases

  - NAG 7.1

  - Intel ifort 2021.6.0

  - Intel ifx 2022.21.0

  - Nvidia nvfortran 22.5

  - gfortran 12.1.0.

  - Cray 10.0.4

- Revision 6 is an update that covers the following releases

  - NAG 7.2

  - Intel ifort 2021.13.0

  - Intel ifx 2025.3.0

  - gfortran 15.2.0

  - Nvidia nvfortran 25.11

  - Cray 16.0.1

1.2   Introduction

The diagnostic capability of compilers is very important both in code development and when teaching Fortran. Polyhedron Solutions provide Fortran compiler comparison tables.

`https://fortran.uk/fortran-compiler-comparisons/`

The Windows diagnostic tables can be found at

`https://fortran.uk/fortran-compiler-comparisons/win32-for-tran-compiler-comparisons-diagnostic-capabilities/`

and the Linux diagnostic tables can be found at

`https://fortran.uk/fortran-compiler-compari-sons/intellinux-fortran-compiler-diagnostic-capabilities/`

1.3   History of compilers we have used

We have used several compilers for the development of the examples in our books. The following table summarises this information.

Books	Introducing Fortran 90	Introducing Fortran 95	Introduction to Programming with Fortran			
Edition(s)			1	2	3	4
Year of publication	1995	2000	2006	2012	2015	2018
Compilers						
CVF	Yes	Yes	Yes			
Cray				Yes	Yes	Yes
DEC	Yes	Yes				
g95						
gfortran				Yes	Yes	Yes
IBM				Yes		
Intel			Yes	Yes	Yes	Yes
Lahey			Yes			
NAG	Yes	Yes	Yes	Yes	Yes	Yes
Oracle						Yes
Salford	Yes	Yes	Yes			
Sun				Yes	Yes	

1.4   Currently used compilers

We currently use the NAG, Intel, Cray, gfortran, and Nvidia compilers, and we have used the Polyhedron Solutions Fortran compiler diagnostic suite in testing the following releases

- Cray: 16.0.1
- gfortran: 15.2.0
- Intel ifort: 2021.13.0
- Intel ifx: 2025.3.0
- NAG: 7.2
- Nvidia 25.11

1.5   Polyhedron diagnostic test suite

The Polyhedron source code exists for both Linux and Windows. The first table lists the source code test and run time error.

Source	Run time error
A01 and A02	Can mix checked and unchecked code
ARG1	argument mismatch: same file
ARG2	argument mismatch: different files
ARG3	Illegal assignment to constant argument: no INTENT specified
ARG4	Illegal assignment to constant argument: INTENT specified
ARG5	Illegal assignment to DO loop variable in SUBROUTINE: no INTENT specified
ARG6	Illegal assignment to DO loop variable in SUBROUTINE: INTENT specified
ARG7	Scalar constant passed to array dummy argument
OARG1	Illegal use of optional argument
ALIAS1	Aliased dummy argument variable10
ALIAS2	Aliased dummy argument array
BND1	array bound error: X(100)
BND2	array bound error: X(N) N is argument
BND3	array bound error: X(N) N is in COMMON
BND4	array bound error: X(N) N is in MODULE
BND5	array bound error: X(*)
BND6	array bound error: X(M:N) M and N argument question lower bound violated
BND7	array bound error: automatic array
BND8	array bound error: allocatable array
BND9	multi-dimensional array bound error within overall array bounds
BND10	array bound error: assign to dummy argument which is larger than actual argument
BND11	array bound error: pointer array component of derived type

Source	Run time error
CBND1	character bound error: local
CBND2	character bound error: COMMON
CBND3	character bound error: assign to dummy which is larger than actual argument
CBND4	character bound error: CHARACTER*(*)
UIN1	uninitialized variable7: local
UIN2	uninitialized variable: argument
UIN3	uninitialized variable: COMMON
UIN4	uninitialized variable: MODULE
UIN5	uninitialized array element: local
UIN6	uninitialized array element: argument
UIN7	uninitialized array element: COMMON
UIN8	uninitialized array element: MODULE
UIN9	uninitialized array element: local array in SUBROUTINE
UIN10	uninitialized array element: automatic arrays
UIN11	uninitialized array element: allocatable arrays
UIN12	uninitialized array element: saved arrays
UIN13	uninitialized array element: INTENT(OUT) arrays
UIN14	two byte array elements
UIN15	one byte array elements
DO1	zero increment DO loop
DO2	Illegal assignment to local DO loop variable
DO3	Illegal assignment to local DO loop variable via EQUIVALENCE
DO4	Illegal assignment to DO variables in CONTAINed subprogram
SF1	SUBROUTINE referenced as a FUNCTION: same file
SF2	SUBROUTINE referenced as a FUNCTION: different file6
FH1	Same file opened on 2 different units
FMT1	Illegal run-time format

Source	Run time error
CONF	Non-conformant array assignment
PTR1	Assign via pointer after target deallocated
PTR2	Assign via global pointer to local array after subprogram return
None	Full trace back from run-time errors

1.6 Compiler diagnostic results

The next table has the diagnostic results for each compiler.

	Cray	gfortran	ifort	ifx	nag	nvidia
	16.0.1	15.2.0	2021.13.0	2025.3.0	7.2	25.11
	47	57	55	53	96	32
	NA	0.701	2.609	3.969	19.047	7.402
A01 and A02	Yes	Yes	Yes	Yes	Yes	Yes
ARG1	Yes 3	Yes 4	Yes 4	Yes 4	Yes 4	No
ARG2	No	No	Yes 4,8	Yes 4,8	Yes 5	No
ARG3	No	Yes 5	Yes 5,9	Yes 5,9	Yes 5	No 31
ARG4	No	Yes 4	Yes 4	Yes 4	Yes 4	No 31
ARG5	No	No	No	No	Yes 5	No
ARG6	Yes 3	Yes 4	Yes 4	Yes 4	Yes 4	No
ARG7	Yes 3	Yes 4	Yes 4	Yes 4	Yes 4	No
OARG1	Yes 5	No 5	Yes 5,9	Yes 5,9	Yes 5	No 31
ALIAS1	No	No	No	No	Yes	No
ALIAS2	No	No	No	No	No	No
BND1	Yes 5	Yes 5	Yes 5	Yes 5	Yes 5	Yes 5
BND2	Yes 5	Yes 5	Yes 5	Yes 5	Yes 5	Yes 5
BND3	Yes 5	Yes 5	Yes 5	Yes 5	Yes 5	Yes 5
BND4	Yes 5	Yes 5	Yes 5	Yes 5	Yes 5	Yes 5

DIV0	Option	Option	Option	Option	Option	No
IOFL	Option	Silent	Silent	Silent	Option	No
None	No	No 32	Yes	Yes	Yes	No

Here are the notes for the table.

1.7 Notes

1   Percentage Passes is calculated from a total of 53 tests. No score is assigned for exception handling.

2   Execution Time for TFFT.for, compiled using the diagnostic switches (see table above) measured on the same machine as the benchmarks.

3   Compiler issued warning message.

4   Compiler issued fatal error message – no executable produced.

5   Run-time message.

6   Arranged so that error is not visible at compile time.

7   A variable is "uninitialized" if it has never been assigned a value. Data elements should be initialized before their value is used. The illegal use of an uninitialized variable can sometimes be detected at compile-time, but, because it may be data and flow dependent, usually requires run-time monitoring. In some cases, compilers implement this by checking for a special "uninitialized" bit pattern, such as 0x80, but this may result in false positives for one or two byte variables (and, rarely, in other cases). Use of a "shadow array" doubles memory requirements, but avoids false positives.

8   Compilation order dependent. Compiler generates .mod file to allow interface checking.

9   Non-specific error message, but full traceback.

10   Spotted by Forcheck.

11   The test is passed if the program refuses the second open. For some reason, the Fortran standard does not allow a file to be opened twice, even for read-only access. It has been argued to me that allowing the second open is an extension to the standard, rather than a failure to spot an error.

12   False positive detected

20   compiler option -ftrap=overflow,underflow. Has no effect

30   The Cray compiler has a N/A entry for tfft execution time as the timing for this compiler was done using the UK HPC systems at Edinburgh. The other timing figures are on the same system.

31   Segfault. No additional information.

32   gfortran under Linux provides a full run time trace back.

33   The results for gfortran, ifort, ifx and Nag are under Windows. The Cray and nvidia compiler results are under Linux.

Intel warnings - Many of the examples generate the following error message: Warning #8889:: Explicit interface or EXTERNAL declaration is required. [SUB]

Some problems (e.g. tfft) need to be compiled and ran manually due to batch file processing on Windows.

1.8   Compiler switches

Here are the compiler swicthes used.

- cray
  - crayftn -eC -eD -g -R bcdps -K trap=fp
- gfortran
  - gfortran -W -Wall -fbounds-check -pedantic-errors -Wunderflow -O -fbacktrace -ffpe-trap=zero,overflow,underflow -g
- intel ifort
  - ifort /check:all /fpe:0 /traceback /warn:all,nodec,interfaces /Qfp-stack-check /automatic /gen_interfaces

- intel ifx
  - ifx /check:all /fpe:0 /traceback /warn:all,nodec,interfaces /Qfp-stack-check /gen_interfaces
- nag
  - nagfor -C=all -C=undefined
- nvidia
  - pgf90 -g -Mbounds -Mchkstk -Mchkptr -Mchkfpstk -Minform=inform -C -Ktrap=divz,fp,ovf,unf

1.9 Summary

The NAG compiler has the highest diagnostic rating using the Polyhedron code suite.
